BE Semester- 7th (Computer Engineering) Question Bank

(Compiler Construction)

All questions carry equal marks(10 marks)

 Q.2 Briefly explain the problems associated with top-down parser. Q.3 Show that the grammar below is ambiguous. S → S + S S * S id Give an unambiguous grammar for the above grammar such that + has higher priority. * has less priority and both are right associative. Q.4 Given the grammar S → a (L) L → L, S S Check the resultant grammar is LL(1) or not. Q.5 What is symbol table? Discuss any two data structures suitable for it and compare their merits and demerits. Q.6 Explain the different error recovery strategies. Q.7 a) Give a CFG for the language of all non-palindromes over { 0 , 1}* b) Draw the parse tree for following: S → S S (S) () Q.8 Briefly explain the main issues in code generation. Q.9 Describe the method of generating intermediate code for the flow control statements. Q.10 Explain the left-recursion and show how it is eliminated. Describe the algorithm used for eliminating the left recursion. Q.11 Explain the left-recursion and show how it is eliminated. Describe the algorithm used for eliminating the left recursion. Q.12 Explain non-recursive predictive parsers. Draw the block diagram of it. Q.13 Write the two methods used in lexical analyzer for buffering the input. Which technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note: a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.	Q.1	Draw and explain the different phases of compiler.
S → S + S S * S id Give an unambiguous grammar for the above grammar such that + has higher priority, * has less priority and both are right associative. Q.4 Given the grammar S → a (L) L → L, S S Check the resultant grammar is LL(1) or not. Q.5 What is symbol table? Discuss any two data structures suitable for it and compare their merits and demerits. Q.6 Explain the different error recovery strategies. Q.7 a) Give a CFG for the language of all non-palindromes over { 0 , 1} ' b) Draw the parse tree for following: S → S S (S) () Q.8 Briefly explain the main issues in code generation. Q.9 Describe the method of generating intermediate code for the flow control statements. Q.10 Explain the left-recursion and show how it is eliminated. Describe the algorithm used for eliminating the left recursion. Q.11 Explain the analysis synthesis model of compilation. List the factors that affect the design of compiler. Also List major functions done by compiler. Q.12 Explain non-recursive predictive parsers. Draw the block diagram of it. Q.13 Write the two methods used in lexical analyzer for buffering the input. Which technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note: a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E ₁ +E ₂ Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Explain three address code mechanisms for intermediate code	Q.2	
Give an unambiguous grammar for the above grammar such that + has higher priority, * has less priority and both are right associative. Q.4 Given the grammar S → a (L) L → L, S S Check the resultant grammar is LL(1) or not. Q.5 What is symbol table? Discuss any two data structures suitable for it and compare their merits and demerits. Q.6 Explain the different error recovery strategies. Q.7 a) Give a CFG for the language of all non-palindromes over { 0 , 1} ' b) Draw the parse tree for following: S → S S (S) () Q.8 Briefly explain the main issues in code generation. Q.9 Describe the method of generating intermediate code for the flow control statements. Q.10 Explain the left-recursion and show how it is eliminated. Describe the algorithm used for eliminating the left recursion. Q.11 Explain the analysis synthesis model of compilation. List the factors that affect the design of compiler. Also List major functions done by compiler. Q.12 Explain non-recursive predictive parsers. Draw the block diagram of it. Q.13 Write the two methods used in lexical analyzer for buffering the input. Which technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note: a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E ₁ +E ₂ Q.19 Explain how a compiler between annotated parse tree and parse tree? Explain peephole optimization. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Explain three address code mechanisms for intermediate code	Q.3	Show that the grammar below is ambiguous.
 higher priority, * has less priority and both are right associative. Q.4 Given the grammar S → a (L) L → L, S S Check the resultant grammar is LL(1) or not. Q.5 What is symbol table? Discuss any two data structures suitable for it and compare their merits and demerits. Q.6 Explain the different error recovery strategies. Q.7 a) Give a CFG for the language of all non-palindromes over { 0 , 1} b) Draw the parse tree for following: S → S S (S) () Q.8 Briefly explain the main issues in code generation. Q.9 Describe the method of generating intermediate code for the flow control statements. Q.10 Explain the left-recursion and show how it is eliminated. Describe the algorithm used for eliminating the left recursion. Q.11 Explain the analysis synthesis model of compilation. List the factors that affect the design of compiler. Also List major functions done by compiler. Q.12 Explain non-recursive predictive parsers. Draw the block diagram of it. Q.13 Write the two methods used in lexical analyzer for buffering the input. Which technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note: a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E->E₁+E₂ Q.19 Explain peephole optimization. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code 		$S \rightarrow S + S \mid S * S \mid id$
 Q.4 Given the grammar S → a (L) L → L, S S Check the resultant grammar is LL(1) or not. Q.5 What is symbol table? Discuss any two data structures suitable for it and compare their merits and demerits. Q.6 Explain the different error recovery strategies. Q.7 a) Give a CFG for the language of all non-palindromes over { 0 , 1} b) Draw the parse tree for following: S → S S (S) () Q.8 Briefly explain the main issues in code generation. Q.9 Describe the method of generating intermediate code for the flow control statements. Q.10 Explain the left-recursion and show how it is eliminated. Describe the algorithm used for eliminating the left recursion. Q.11 Explain the analysis synthesis model of compilation. List the factors that affect the design of compiler. Also List major functions done by compiler. Q.12 Explain non-recursive predictive parsers. Draw the block diagram of it. Q.13 Write the two methods used in lexical analyzer for buffering the input. Which technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note: a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E₁+E₂ Q.19 Explain the following in relation to optimization. 1) Common subexpressions 2) Copy propagation. Q.20 Explain three address code mechanisms for intermediate code Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code 		Give an unambiguous grammar for the above grammar such that + has
S → a (L) L → L, S S Check the resultant grammar is LL(1) or not. Q.5 What is symbol table? Discuss any two data structures suitable for it and compare their merits and demerits. Q.6 Explain the different error recovery strategies. Q.7 a) Give a CFG for the language of all non-palindromes over { 0 , 1} b) Draw the parse tree for following: S → S S (S) () Q.8 Briefly explain the main issues in code generation. Q.9 Describe the method of generating intermediate code for the flow control statements. Q.10 Explain the left-recursion and show how it is eliminated. Describe the algorithm used for eliminating the left recursion. Q.11 Explain the analysis synthesis model of compilation. List the factors that affect the design of compiler. Also List major functions done by compiler. Q.12 Explain non-recursive predictive parsers. Draw the block diagram of it. Q.13 Write the two methods used in lexical analyzer for buffering the input. Which technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note: a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E ₁ +E ₂ Q.19 Explain the following in relation to optimization. 1) Common subexpressions 2) Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code		higher priority, * has less priority and both are right associative.
L → L, S S Check the resultant grammar is LL(1) or not. Q.5 What is symbol table? Discuss any two data structures suitable for it and compare their merits and demerits. Q.6 Explain the different error recovery strategies. Q.7 a) Give a CFG for the language of all non-palindromes over { 0 , 1} b) Draw the parse tree for following: S → S S (S) () Q.8 Briefly explain the main issues in code generation. Q.9 Describe the method of generating intermediate code for the flow control statements. Q.10 Explain the left-recursion and show how it is eliminated. Describe the algorithm used for eliminating the left recursion. Q.11 Explain the analysis synthesis model of compilation. List the factors that affect the design of compiler. Also List major functions done by compiler. Q.12 Explain non-recursive predictive parsers. Draw the block diagram of it. Q.13 Write the two methods used in lexical analyzer for buffering the input. Which technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note: a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E→E₁+E₂ Q.19 Explain the following in relation to optimization. 1) Common subexpressions 2) Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Explain three address code mechanisms for intermediate code	Q.4	
 Check the resultant grammar is LL(1) or not. Q.5 What is symbol table? Discuss any two data structures suitable for it and compare their merits and demerits. Q.6 Explain the different error recovery strategies. Q.7 a) Give a CFG for the language of all non-palindromes over { 0 , 1} o) Draw the parse tree for following: S → S S (S) () Q.8 Briefly explain the main issues in code generation. Q.9 Describe the method of generating intermediate code for the flow control statements. Q.10 Explain the left-recursion and show how it is eliminated. Describe the algorithm used for eliminating the left recursion. Q.11 Explain the analysis synthesis model of compilation. List the factors that affect the design of compiler. Also List major functions done by compiler. Q.12 Explain non-recursive predictive parsers. Draw the block diagram of it. Q.13 Write the two methods used in lexical analyzer for buffering the input. Which technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note: a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E→E₁+E₂ Q.19 Explain the following in relation to optimization.		
 Q.5 What is symbol table? Discuss any two data structures suitable for it and compare their merits and demerits. Q.6 Explain the different error recovery strategies. Q.7 a) Give a CFG for the language of all non-palindromes over { 0 , 1} or b) Draw the parse tree for following: S → S S (S) () Q.8 Briefly explain the main issues in code generation. Q.9 Describe the method of generating intermediate code for the flow control statements. Q.10 Explain the left-recursion and show how it is eliminated. Describe the algorithm used for eliminating the left recursion. Q.11 Explain the analysis synthesis model of compilation. List the factors that affect the design of compiler. Also List major functions done by compiler. Q.12 Explain non-recursive predictive parsers. Draw the block diagram of it. Q.13 Write the two methods used in lexical analyzer for buffering the input. Which technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note:		' !
 compare their merits and demerits. Q.6 Explain the different error recovery strategies. Q.7 a) Give a CFG for the language of all non-palindromes over { 0 , 1}* b) Draw the parse tree for following: S → S S (S) () Q.8 Briefly explain the main issues in code generation. Q.9 Describe the method of generating intermediate code for the flow control statements. Q.10 Explain the left-recursion and show how it is eliminated. Describe the algorithm used for eliminating the left recursion. Q.11 Explain the analysis synthesis model of compilation. List the factors that affect the design of compiler. Also List major functions done by compiler. Q.12 Explain non-recursive predictive parsers. Draw the block diagram of it. Q.13 Write the two methods used in lexical analyzer for buffering the input. Which technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note: a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E₁+E₂ Q.19 Explain the following in relation to optimization. 1) Common subexpressions 2) Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code 		
 Q.6 Explain the different error recovery strategies. Q.7 a) Give a CFG for the language of all non-palindromes over { 0 , 1} or b) Draw the parse tree for following: S → S S (S) () Q.8 Briefly explain the main issues in code generation. Q.9 Describe the method of generating intermediate code for the flow control statements. Q.10 Explain the left-recursion and show how it is eliminated. Describe the algorithm used for eliminating the left recursion. Q.11 Explain the analysis synthesis model of compilation. List the factors that affect the design of compiler. Also List major functions done by compiler. Q.12 Explain non-recursive predictive parsers. Draw the block diagram of it. Q.13 Write the two methods used in lexical analyzer for buffering the input. Which technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note:	Q.5	
 Q.7 a) Give a CFG for the language of all non-palindromes over { 0 , 1} b) Draw the parse tree for following:		
b) Draw the parse tree for following: S → S S (S) () Q.8 Briefly explain the main issues in code generation. Q.9 Describe the method of generating intermediate code for the flow control statements. Q.10 Explain the left-recursion and show how it is eliminated. Describe the algorithm used for eliminating the left recursion. Q.11 Explain the analysis synthesis model of compilation. List the factors that affect the design of compiler. Also List major functions done by compiler. Q.12 Explain non-recursive predictive parsers. Draw the block diagram of it. Q.13 Write the two methods used in lexical analyzer for buffering the input. Which technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note: a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E₁+E₂ Q.19 Explain the following in relation to optimization. 1) Common subexpressions 2) Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code		
S → S S (S) () Q.8 Briefly explain the main issues in code generation. Q.9 Describe the method of generating intermediate code for the flow control statements. Q.10 Explain the left-recursion and show how it is eliminated. Describe the algorithm used for eliminating the left recursion. Q.11 Explain the analysis synthesis model of compilation. List the factors that affect the design of compiler. Also List major functions done by compiler. Q.12 Explain non-recursive predictive parsers. Draw the block diagram of it. Q.13 Write the two methods used in lexical analyzer for buffering the input. Which technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note:	Q.7	
 Q.8 Briefly explain the main issues in code generation. Q.9 Describe the method of generating intermediate code for the flow control statements. Q.10 Explain the left-recursion and show how it is eliminated. Describe the algorithm used for eliminating the left recursion. Q.11 Explain the analysis synthesis model of compilation. List the factors that affect the design of compiler. Also List major functions done by compiler. Q.12 Explain non-recursive predictive parsers. Draw the block diagram of it. Q.13 Write the two methods used in lexical analyzer for buffering the input. Which technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note: a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E₁+E₂ Q.19 Explain the following in relation to optimization. 1) Common subexpressions 2) Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code 		, ,
 Q.9 Describe the method of generating intermediate code for the flow control statements. Q.10 Explain the left-recursion and show how it is eliminated. Describe the algorithm used for eliminating the left recursion. Q.11 Explain the analysis synthesis model of compilation. List the factors that affect the design of compiler. Also List major functions done by compiler. Q.12 Explain non-recursive predictive parsers. Draw the block diagram of it. Q.13 Write the two methods used in lexical analyzer for buffering the input. Which technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note: a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E₁+E₂ Q.19 Explain the following in relation to optimization. 1) Common subexpressions 2) Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code 	0.0	
Statements. Q.10 Explain the left-recursion and show how it is eliminated. Describe the algorithm used for eliminating the left recursion. Q.11 Explain the analysis synthesis model of compilation. List the factors that affect the design of compiler. Also List major functions done by compiler. Q.12 Explain non-recursive predictive parsers. Draw the block diagram of it. Q.13 Write the two methods used in lexical analyzer for buffering the input. Which technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note: a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E ₁ +E ₂ Q.19 Explain the following in relation to optimization. 1) Common subexpressions 2) Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code		
 Q.10 Explain the left-recursion and show how it is eliminated. Describe the algorithm used for eliminating the left recursion. Q.11 Explain the analysis synthesis model of compilation. List the factors that affect the design of compiler. Also List major functions done by compiler. Q.12 Explain non-recursive predictive parsers. Draw the block diagram of it. Q.13 Write the two methods used in lexical analyzer for buffering the input. Which technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note: a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E₁+E₂ Q.19 Explain the following in relation to optimization. 1) Common subexpressions 2) Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code 	Q.9	<u> </u>
algorithm used for eliminating the left recursion. Q.11 Explain the analysis synthesis model of compilation. List the factors that affect the design of compiler. Also List major functions done by compiler. Q.12 Explain non-recursive predictive parsers. Draw the block diagram of it. Q.13 Write the two methods used in lexical analyzer for buffering the input. Which technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note: a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E ₁ +E ₂ Q.19 Explain the following in relation to optimization. 1) Common subexpressions 2) Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code	O 10	
 Q.11 Explain the analysis synthesis model of compilation. List the factors that affect the design of compiler. Also List major functions done by compiler. Q.12 Explain non-recursive predictive parsers. Draw the block diagram of it. Q.13 Write the two methods used in lexical analyzer for buffering the input. Which technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note: a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E₁+E₂ Q.19 Explain the following in relation to optimization. 1) Common subexpressions 2) Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code 	Q. 10	
affect the design of compiler. Also List major functions done by compiler. Q.12 Explain non-recursive predictive parsers. Draw the block diagram of it. Q.13 Write the two methods used in lexical analyzer for buffering the input. Which technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note: a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E ₁ +E ₂ Q.19 Explain the following in relation to optimization. 1) Common subexpressions 2) Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code	Q.11	
 Q.12 Explain non-recursive predictive parsers. Draw the block diagram of it. Q.13 Write the two methods used in lexical analyzer for buffering the input. Which technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note: a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E₁+E₂ Q.19 Explain the following in relation to optimization. 1) Common subexpressions 2) Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code 		
technique is used for speeding up the lexical analyzer? Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note: a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E ₁ +E ₂ Q.19 Explain the following in relation to optimization. 1) Common subexpressions 2) Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code	Q.12	
 Q.14 Write ambiguous and unambiguous production rules for if then else construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note: a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E₁+E₂ Q.19 Explain the following in relation to optimization. 1) Common subexpressions 2) Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code 	Q.13	Write the two methods used in lexical analyzer for buffering the input. Which
construct. Illustrate parsing using both types of rules by giving an example. Also explain left factoring and its use. Q.15 Write a short note:		
Also explain left factoring and its use. Q.15 Write a short note: a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E ₁ +E ₂ Q.19 Explain the following in relation to optimization. 1) Common subexpressions 2) Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code	Q.14	
Q.15 Write a short note:		
a) lexical errors b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E ₁ +E ₂ Q.19 Explain the following in relation to optimization. 1) Common subexpressions 2) Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code		
b) synthesized and inherited attribute Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E ₁ +E ₂ Q.19 Explain the following in relation to optimization. 1) Common subexpressions 2) Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code	Q.15	
 Q.16 What are passes? What is the effect of reducing the number of passes? Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E₁+E₂ Q.19 Explain the following in relation to optimization. Common subexpressions Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code 		·
 Q.17 Explain how a compiler handles syntax error? Q.18 What is a dependency graph? Draw dependency graph for the expression E->E₁+E₂ Q.19 Explain the following in relation to optimization. Common subexpressions Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code 	0.16	
 Q.18 What is a dependency graph? Draw dependency graph for the expression E->E₁+E₂ Q.19 Explain the following in relation to optimization. Common subexpressions Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code 	-	
 E->E₁+E₂ Q.19 Explain the following in relation to optimization. 1) Common subexpressions 2) Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code 		
 Q.19 Explain the following in relation to optimization. Common subexpressions Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code 	Q. 10	
1) Common subexpressions 2) Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code	Q 19	• -
2) Copy propagation. Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code	Q. 10	
 Q.20 Explain peephole optimization. Q.21 What is the difference between annotated parse tree and parse tree? Q.22 Explain three address code mechanisms for intermediate code 		
Q.21 What is the difference between annotated parse tree and parse tree?Q.22 Explain three address code mechanisms for intermediate code	Q.20	
Q.22 Explain three address code mechanisms for intermediate code		
representation.		
		representation.

Q.23	How to perform closure and GOTO in case of LR parsing? Give example.
Q.24	Explain the use of loaders and linkers.
Q.25	Explain with suitable example the calculation of the FOLLOW set.
Q.26	Explain-prefix, suffix, substring, subsequence of string.
Q.27	Explain with suitable example CLR(canonical LR) parsing technique.
Q.28	Write grammar for comma separated list of identifiers.
Q.29	Explain code optimization technique.
Q.30	Construct the collection of LR(0) item sets for the following grammar.
	E'→E
	E .E.TIT
	E→E+T T
	T→T*F F
	'
	$F\rightarrow (E) id$
Q.31	Write an algorithm for left factoring a grammar.
Q.32	Describe the language denoted by following regular expression
	(i) 0/0I4)*0
	(i) 0(0 1)*0 (ii) (0 1)*0(0 1)(0 1)
Q.33	(ii) (0 1)*0(0 1)(0 1) Explain the difference between context free and context sensitive grammars
Q.55	with an example.
Q.34	Identify tokens, lexeme and pattern from the following statement.
	grant of the grant
	const pi=3.1416
Q.35	Explain heap allocation.
Q.36	Explain (i) handles (ii) handle pruning
Q.37	Consider the grammar
	5→(L) a
	$S\rightarrow (L) a$ $L\rightarrow L,S S$
	Find parse tree for the following sentences
	(i) (a,a)
0.00	(ii) (a,(a,a))
Q.38	Explain preprocessors.
Q.39	How Lookahead LR(LALR) parsing technique works?-give example.
Q.40	Draw transition diagram for signed numbers.
